---

1. Introduction

This document describes a GitHub App that reviews pull requests using AWS Bedrock and Lambda. The authored functional architecture remains stable while deployment/runtime/code evidence is inferred from infrastructure manifests, source files, and verification artifacts.

1.1. Scope and Assumptions

- Functional Groups and Functional Units are the stable authored design backbone.
- Runtime and code realization are inferred from available IaC, deployment, and source artifacts.
- Inferred coverage is evidence-driven and may be partial when source metadata is missing.
- Requirement alignment and reference indexes are provided for traceability, not as primary narrative flow.

2. How To Read This Document

This document is intentionally split into two layers:

1. Concept layer: functional and view-specific architecture narratives for human understanding.
2. Evidence layer: generated requirement traceability and inferred reference indexes.

Read in this order:

1. Architecture Intent View: stable authored architecture intent and ownership boundaries.
2. Communication / Deployment / Security Views: viewpoint-specific operational behavior.
3. Traceability View: requirement mapping, evidence coverage, and confidence.
4. Reference Appendix: supporting reference IDs and inferred-source links.

3. Document Health Snapshot

View	Authored Status	Authored Status Explanation	Units in Scope	Direct Evidence Coverage	Gap Count	Heuristic Confidence	Heuristic Basis
Architecture Intent View (`VIEW-ARCHITECTURE-INTENT`)	stable	Authored capability boundaries and ownership responsibilities are stable for this release.	7	7	0	high	Defaults authored units to covered; use authoredStatus as the primary publication signal.
Communication View (`VIEW-COMMUNICATION`)	in-review	Communication sequencing is defined, while protocol-level metadata is still being expanded.	7	0	7	low	Counts a unit as covered when direct inferred runtime evidence exists.
Deployment View (`VIEW-DEPLOYMENT`)	in-review	Deployment and runtime mapping are present; observability and ownership evidence are still evolving.	7	0	7	low	Counts a unit as covered when direct inferred runtime evidence exists.
Security View (`VIEW-SECURITY`)	draft	Core threats are modeled; control-depth and detection mappings are still being expanded.	7	5	2	medium	Counts a unit as covered when explicit authored attack-vector mapping exists.
Traceability View (`VIEW-TRACEABILITY`)	in-review	Requirement mappings exist; evidence completeness and consistency are still being hardened.	7	7	7	high	Counts a unit as covered when direct inferred runtime or code evidence exists.

4. Terms and Definitions

Term	Definition
actor (EM-ACTOR)	A person or operational role that interacts with functional units.
ai review is enabled (FEAT-AI-REVIEW)	Feature flag enabling model-assisted review. Aliases:ai review enabled
attack vector (EM-ATTACK-VECTOR)	A technical misuse or attack path that targets functional, referenced, or runtime elements.
audit logging is enabled (FEAT-AUDIT-LOGGING)	Feature flag enabling audit metadata persistence. Aliases:audit enabled
authored mapping (EM-AUTHORED-MAPPING)	An explicit relationship declared in architecture inputs between authored or referenced elements.
aws sdk for go (REF-AWS-SDK-GO)	SDK dependency used for AWS runtime integrations. Aliases:aws sdk
aws secrets manager (REF-AWS-SECRETS-MANAGER)	Managed secret store for application credentials and config values. Aliases:secrets manager
bedrock runtime (REF-AWS-BEDROCK-RUNTIME)	External Bedrock runtime endpoint used for model inference. Aliases:bedrock api
bedrock runtime is unavailable (EVT-BEDROCK-UNAVAILABLE)	Event raised when Bedrock inference path is degraded. Aliases:bedrock unavailable
check run summary (DATA-CHECKRUN-SUMMARY)	Aggregated review result posted as a GitHub check run.
code element (EM-CODE-ELEMENT)	An inferred code structure or ownership element discovered from source trees and build metadata.
developer (ACT-DEVELOPER)	Engineer opening and updating pull requests. Aliases:pr author
diff context (DATA-DIFF-CONTEXT)	Pull request file changes and metadata prepared for analysis.
diff context is prepared (EVT-CONTEXT-PREPARED)	Event indicating context assembly completed and is ready for analysis. Aliases:context prepared
functional group (EM-FUNCTIONAL-GROUP)	A major authored capability area that groups related functional units.
functional unit (EM-FUNCTIONAL-UNIT)	An authored working unit inside a functional group that owns specific behavior.
github app api (REF-GITHUB-APP-API)	External GitHub API used for pull request metadata and review publication. Aliases:github api

Term	Definition
github rest sdk (REF-GITHUB-REST-SDK)	SDK dependency used for GitHub App REST interactions. Aliases:github sdk
github webhook ingress (FU-GITHUB-WEBHOOK-INGRESS)	Validates webhook signatures and routes trusted pull request events. Aliases:webhook ingress
inferred mapping (EM-INFERRED-MAPPING)	A discovered relationship that links inferred runtime/code elements upward to authored design.
lambda runtime operations (FU-LAMBDA-RUNTIME-OPERATIONS)	Manages runtime deployment and operational controls. Aliases:lambda ops
normal mode is active (MODE-NORMAL)	Default operating mode using AI plus deterministic checks. Aliases:normal mode
platform operations (FG-PLATFORM-OPERATIONS)	Functional group for deployment lifecycle and secret/config controls. Aliases:runtime operations
platform operator (ACT-PLATFORM-OPERATOR)	Owner of deployment/runtime operations and reliability controls. Aliases:platform ops
policy checks (FU-POLICY-CHECKS)	Evaluates deterministic repository policy checks. Aliases:deterministic checks
policy checks are enabled (FEAT-POLICY-CHECKS)	Feature flag enabling deterministic policy checks. Aliases:policy checks enabled
policy ruleset (REF-POLICY-RULESET)	Deterministic review policy bundle used during analysis. Aliases:policy bundle
pr context assembly (FU-PR-CONTEXT-ASSEMBLY)	Fetches changed files and prepares bounded review context payloads. Aliases:context assembly
pr integration (FG-PR-INTEGRATION)	Functional group for webhook ingress and pull request context intake. Aliases:github integration
prompt injection in diff (AV-PROMPT-INJECTION-IN-DIFF)	Malicious prompt-like content embedded in pull request code changes. Aliases:prompt injection
pull request opened event is received (EVT-PR-OPENED)	Event raised when a new pull request is opened. Aliases:pr opened
pull request review is active (STATE-PR-REVIEW-ACTIVE)	State where review processing is currently active for a pull request. Aliases:review active
pull request spam abuse (AV-PR-SPAM-ABUSE)	High-volume event abuse causing review capacity exhaustion. Aliases:pr spam

Term	Definition
pull request synchronize event is received (EVT-PR-SYNCHRONIZE)	Event raised when new commits are pushed to an open pull request. Aliases:pr synchronize
redacted audit metadata (DATA-REDACTED-AUDIT-METADATA)	Sanitized prompt and finding metadata retained for audit.
referenced element (EM-REFERENCED-ELEMENT)	An architecture-relevant external, platform, or third-party dependency represented by role.
repository maintainer (ACT-REPOSITORY-MAINTAINER)	Owner of merge decisions and repository quality gates. Aliases:maintainer
result metadata (DATA-RESULT-METADATA)	Metadata describing review output characteristics for audit and reporting.
review findings are generated (EVT-FINDINGS-GENERATED)	Event indicating analysis output is ready for publication. Aliases:findings generated
review findings are published (EVT-FINDINGS-PUBLISHED)	Event indicating review output has been published to GitHub checks/comments. Aliases:findings published
review intelligence (FG-REVIEW-INTELLIGENCE)	Functional group for AI and deterministic review analysis and publication. Aliases:pr review system
review orchestration (FU-REVIEW-ORCHESTRATION)	Coordinates Bedrock analysis with deterministic checks and fallback logic. Aliases:orchestration
review publication (FU-REVIEW-PUBLICATION)	Publishes review findings to GitHub checks and comments. Aliases:publication
review request rate limit is exceeded (EVT-RATE-LIMIT-EXCEEDED)	Event raised when PR review rate guardrails are hit. Aliases:rate limit exceeded
runtime element (EM-RUNTIME-ELEMENT)	An inferred runtime realization element discovered from infrastructure and deployment sources.
secret leakage in review output (AV-SECRET-LEAKAGE-IN-REVIEW)	Unintended credential disclosure in generated review findings. Aliases:secret leakage
secrets and configuration (FU-SECRETS-CONFIGURATION)	Manages credentials and secure runtime configuration. Aliases:secret config
security engineer (ACT-SECURITY-ENGINEER)	Owner of security policy checks and finding triage. Aliases:security reviewer
spoofed github webhook (AV-SPOOFED-GITHUB-WEBHOOK)	Forged webhook request attempting unauthorized review execution. Aliases:webhook spoofing

Term	Definition
upward linking (EM-UPWARD-LINKING)	Rule where runtime and code elements point to stable functional groups/units; authored architecture does not depend on inferred IDs.
webhook signature (DATA-WEBHOOK-SIGNATURE)	Signature used to verify webhook authenticity.
webhook signature is valid (COND-WEBHOOK-SIGNATURE-VALID)	Condition indicating webhook HMAC verification succeeded. Aliases:signature valid

4.1. Diagram Color and Shape Legend

This legend applies to all Mermaid diagrams in this document.

5. Architecture Intent View

Show the stable authored architecture intent: capability areas, unit ownership boundaries, and intentional responsibility split.

5.1. What This View Answers

- What are the main capability areas?
- What are the stable units of responsibility and what does each unit own?
- How are responsibilities intentionally split?

5.2. System Boundary Diagram

What this diagram shows: explicit internal vs external scope. Functional units are inside the `System Boundary (Internal)` container, while actors and referenced dependencies are shown outside the boundary.

5.3. System Decomposition Diagram

What this diagram shows: stable capability decomposition from functional groups into functional units.

5.4. Functional Group Manhattan Matrix

What this diagram shows: a table-like matrix where functional groups are the bottom row (columns) and functional units are arranged in rows above their owning group.

	Policy Checks	
GitHub Webhook Ingress	Review Orchestration	Lambda Runtime Operations
PR Context Assembly	Review Publication	Secrets and Configuration
PR Integration	Review Intelligence	Platform Operations

5.5. Functional Unit Dependency Diagram

What this diagram shows: dependency paths between functional units (grouped in Functional Group containers) and key referenced elements. Arrow meaning: `A -→|depends_on| B` means unit `A` requires behavior or data from `B` to fulfill its responsibility.

5.6. Functional Groups (View Scoped)

5.6.1. PR Integration (FG-PR-INTEGRATION)

Description: Ingress and context assembly for GitHub pull request events.

PR Integration owns webhook trust boundaries and pull request context intake. It converts incoming GitHub events into normalized review work with clear boundaries.

PR Integration Architecture Intent

PR Integration defines trusted ingestion boundaries and normalized PR context assembly for downstream review units.

5.6.2. Review Intelligence (FG-REVIEW-INTELLIGENCE)

Description: AI and deterministic review analysis with result publication.

Review Intelligence owns generated findings, deterministic checks, and final publication behavior. It combines Bedrock reasoning with predictable policy checks and emits auditable review outputs.

Review Intelligence Architecture Intent

Review Intelligence defines how AI and deterministic signals are combined and published as actionable PR feedback.

5.6.3. Platform Operations (FG-PLATFORM-OPERATIONS)

Description: Lambda deployment lifecycle, runtime operations, and secrets/configuration.

Platform Operations owns safe deployment, runtime controls, and secret/config lifecycle for the app. It enables dependable review operation without owning business-level review policy semantics.

Platform Operations Architecture Intent

Platform Operations owns deployability, runtime controls, and secure configuration boundaries for the review app.

5.7. Functional Units (View Scoped)

5.7.1. Lambda Runtime Operations (FU-LAMBDA-RUNTIME-OPERATIONS)

Group: FG-PLATFORM-OPERATIONS

Manages Lambda packaging/deployment lifecycle and operational health guardrails.

Lambda Runtime Operations Intent

Owns runtime deployment sequencing, control-plane continuity, and operational safety.

Purpose: Manages Lambda packaging/deployment lifecycle and operational health guardrails. Owned responsibility: functional responsibility for lambda runtime operations; includes decision and orchestration flow to AWS Secrets Manager and decision and orchestration flow to Secrets and Configuration Key collaborators: AWS Secrets Manager, Secrets and Configuration Owned decisions: no explicit authored requirement trigger Key inputs and outputs: consumes none; produces depends_on → AWS Secrets Manager; depends_on → Secrets and Configuration Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.2. Secrets and Configuration (FU-SECRETS-CONFIGURATION)

Group: FG-PLATFORM-OPERATIONS

Manages GitHub App credentials, Bedrock config, and redaction-safe runtime configuration.

Secrets and Configuration Intent

Owns credentials and runtime configuration contracts used by review units.

Purpose: Manages GitHub App credentials, Bedrock config, and redaction-safe runtime configuration. Owned responsibility: functional responsibility for secrets and configuration; primary requirement scope: REQ-PRR-007 Key collaborators: none Owned decisions: REQ-PRR-007 Key inputs and outputs: consumes Lambda Runtime Operations, Review Orchestration, Review Publication; produces derived unit outcomes from authored mappings Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.3. GitHub Webhook Ingress (FU-GITHUB-WEBHOOK-INGRESS)

Group: FG-PR-INTEGRATION

Verifies webhook signatures, validates event type, and starts review workflow routing.

GitHub Webhook Ingress Intent

Accepts and verifies GitHub webhook events before any review processing.

Purpose: Verifies webhook signatures, validates event type, and starts review workflow routing. Owned responsibility: functional responsibility for github webhook ingress; includes decision and orchestration flow to PR Context Assembly; primary requirement scope: REQ-PRR-001, REQ-PRR-008 Key collaborators: PR Context Assembly Owned decisions: REQ-PRR-001, REQ-PRR-008 Key inputs and outputs: consumes none; produces depends_on → PR Context Assembly Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.4. PR Context Assembly (FU-PR-CONTEXT-ASSEMBLY)

Group: FG-PR-INTEGRATION

Fetches changed files and diff metadata and prepares bounded review context payloads.

PR Context Assembly Intent

Builds bounded, review-ready context from pull request files and metadata.

Purpose: Fetches changed files and diff metadata and prepares bounded review context payloads. Owned responsibility: functional responsibility for pr context assembly; includes decision and orchestration flow to GitHub App API and decision and orchestration flow to Review Orchestration; primary requirement scope: REQ-PRR-002 Key collaborators: GitHub App API, Review Orchestration Owned decisions: REQ-PRR-002 Key inputs and outputs: consumes GitHub Webhook Ingress; produces depends_on → GitHub App API; depends_on → Review Orchestration Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.5. Policy Checks (FU-POLICY-CHECKS)

Group: FG-REVIEW-INTELLIGENCE

Runs deterministic checks for secrets, risky IaC changes, and repository policy constraints.

Policy Checks Intent

Performs deterministic repository checks independent of model output.

Purpose: Runs deterministic checks for secrets, risky IaC changes, and repository policy constraints. Owned responsibility: functional responsibility for policy checks; includes decision and orchestration flow to Review Policy Ruleset; primary requirement scope: REQ-PRR-004, REQ-PRR-006 Key collaborators: Review Policy Ruleset Owned decisions: REQ-PRR-004, REQ-PRR-006 Key inputs and outputs: consumes Review Orchestration; produces depends_on → Review Policy Ruleset Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.6. Review Orchestration (FU-REVIEW-ORCHESTRATION)

Group: FG-REVIEW-INTELLIGENCE

Calls Bedrock models, merges AI and deterministic findings, and handles graceful degradation paths.

Review Orchestration Intent

Coordinates model inference and deterministic checks into one review outcome.

Purpose: Calls Bedrock models, merges AI and deterministic findings, and handles graceful degradation paths. Owned responsibility: functional responsibility for review orchestration; includes decision and orchestration flow to AWS Bedrock Runtime API and decision and orchestration flow to Policy Checks; primary requirement scope: REQ-PRR-003, REQ-PRR-006 Key collaborators: AWS Bedrock Runtime API, Policy Checks, Review Publication, Secrets and Configuration Owned decisions: REQ-PRR-003, REQ-PRR-006 Key inputs and outputs: consumes PR Context Assembly; produces depends_on → AWS Bedrock Runtime API; depends_on → Policy Checks; depends_on → Review Publication; depends_on → Secrets and Configuration Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

5.7.7. Review Publication (FU-REVIEW-PUBLICATION)

Group: FG-REVIEW-INTELLIGENCE

Publishes check-run summaries and inline comments back to GitHub pull requests.

Review Publication Intent

Publishes review findings to GitHub checks and comments with clear merge-gate signals.

Purpose: Publishes check-run summaries and inline comments back to GitHub pull requests. Owned responsibility: functional responsibility for review publication; includes decision and orchestration flow to GitHub App API and decision and orchestration flow to Secrets and Configuration; primary requirement scope: REQ-PRR-005, REQ-PRR-006, REQ-PRR-007, REQ-PRR-008 Key collaborators: GitHub App API, Secrets and Configuration Owned decisions: REQ-PRR-005, REQ-PRR-006, REQ-PRR-007, REQ-PRR-008 Key inputs and outputs: consumes Review Orchestration; produces depends_on → GitHub App API; depends_on → Secrets and Configuration Non-goals / boundary notes: this unit boundary is intentionally scoped to authored responsibilities and explicit collaborator contracts.

6. Communication View

Show who communicates with whom across key request paths, including interface edges and dependency handoffs.

6.1. What This View Answers

- Who talks to whom and over which interfaces?
- Which edges are synchronous, asynchronous, event-driven, or callback-oriented?
- Which communication paths are critical to the main request flow?

6.2. Coverage Gaps

Coverage summary: 0/7 units have direct evidence coverage in this view.

- GitHub Webhook Ingress has no direct inferred runtime/deployment evidence yet.
- Lambda Runtime Operations has no direct inferred runtime/deployment evidence yet.
- PR Context Assembly has no direct inferred runtime/deployment evidence yet.
- Policy Checks has no direct inferred runtime/deployment evidence yet.
- Review Orchestration has no direct inferred runtime/deployment evidence yet.
- Review Publication has no direct inferred runtime/deployment evidence yet.
- Secrets and Configuration has no direct inferred runtime/deployment evidence yet.

6.3. Recommended Next Evidence Additions

- Add explicit communication metadata (protocol, sync/async/event/callback) to authored mappings where currently implicit.
- Expose service protocol/port metadata in Helm or manifest values to enrich interface-edge inference.
- Capture missing communicating runtime units by adding discoverable workload artifacts under scanned inference roots.

6.4. Communication Path Graph

What this diagram shows: inferred unit-to-unit request/call flow, including available interface/port labels.

> **NOTE** This graph is inferred from available deployment/runtime artifacts and may be partial. Missing edges or interface details indicate missing derived communication evidence, not necessarily missing behavior.

6.5. Functional Groups (View Scoped)

6.5.1. PR Integration (FG-PR-INTEGRATION)

PR Integration Communication

PR Integration receives webhook events and forwards normalized review context to orchestration with explicit handoff semantics.

6.5.2. Review Intelligence (FG-REVIEW-INTELLIGENCE)

Review Intelligence Communication

Review Intelligence coordinates Bedrock calls, policy evaluation, and publication sequencing for deterministic outcomes.

6.5.3. Platform Operations (FG-PLATFORM-OPERATIONS)

Platform Operations Communication

Platform Operations coordinates runtime controls with app units via deployment and secret/config integration interfaces.

6.6. Functional Units (View Scoped)

6.6.1. Lambda Runtime Operations (FU-LAMBDA-RUNTIME-OPERATIONS)

Group: FG-PLATFORM-OPERATIONS

Lambda Runtime Operations Communication

Operates deployment and runtime controls that indirectly shape request-path reliability.

Communication Aspect	View-Scoped Detail
Inbound interfaces	none
Outbound interfaces	depends_on → AWS Secrets Manager; depends_on → Secrets and Configuration
Messages/events consumed	no explicit authored requirement trigger
Messages/events produced	depends_on → AWS Secrets Manager; depends_on → Secrets and Configuration
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	AWS Secrets Manager, Secrets and Configuration
Communication evidence	code modules: lambda_runtime_ops

6.6.2. Secrets and Configuration (FU-SECRETS-CONFIGURATION)

Group: FG-PLATFORM-OPERATIONS

Secrets and Configuration Communication

Provides secure config retrieval contracts to orchestration and publication units.

Communication Aspect	View-Scoped Detail
Inbound interfaces	Lambda Runtime Operations, Review Orchestration, Review Publication
Outbound interfaces	derived unit outcomes from authored mappings
Messages/events consumed	REQ-PRR-007

Communication Aspect	View-Scoped Detail
Messages/events produced	derived unit outcomes from authored mappings
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	none
Communication evidence	code modules: secrets_configuration

6.6.3. GitHub Webhook Ingress (FU-GITHUB-WEBHOOK-INGRESS)

Group: FG-PR-INTEGRATION

GitHub Webhook Ingress Communication

Receives webhook payloads, validates them, and routes authorized events to context assembly.

Communication Aspect	View-Scoped Detail
Inbound interfaces	none
Outbound interfaces	depends_on → PR Context Assembly
Messages/events consumed	REQ-PRR-001, REQ-PRR-008
Messages/events produced	depends_on → PR Context Assembly
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	PR Context Assembly
Communication evidence	code modules: webhook_ingress

6.6.4. PR Context Assembly (FU-PR-CONTEXT-ASSEMBLY)

Group: FG-PR-INTEGRATION

PR Context Assembly Communication

Calls GitHub APIs and forwards normalized context to orchestration.

Communication Aspect	View-Scoped Detail
Inbound interfaces	GitHub Webhook Ingress
Outbound interfaces	depends_on → GitHub App API; depends_on → Review Orchestration
Messages/events consumed	REQ-PRR-002

Communication Aspect	View-Scoped Detail
Messages/events produced	depends_on → GitHub App API; depends_on → Review Orchestration
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	GitHub App API, Review Orchestration
Communication evidence	code modules: pr_context_assembly

6.6.5. Policy Checks (FU-POLICY-CHECKS)

Group: FG-REVIEW-INTELLIGENCE

Policy Checks Communication

Exchanges policy findings with orchestration for final result composition.

Communication Aspect	View-Scoped Detail
Inbound interfaces	Review Orchestration
Outbound interfaces	depends_on → Review Policy Ruleset
Messages/events consumed	REQ-PRR-004, REQ-PRR-006
Messages/events produced	depends_on → Review Policy Ruleset
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	Review Policy Ruleset
Communication evidence	code modules: policy_checks

6.6.6. Review Orchestration (FU-REVIEW-ORCHESTRATION)

Group: FG-REVIEW-INTELLIGENCE

Review Orchestration Communication

Integrates context input, Bedrock calls, and publication output in a deterministic sequence.

Communication Aspect	View-Scoped Detail
Inbound interfaces	PR Context Assembly
Outbound interfaces	depends_on → AWS Bedrock Runtime API; depends_on → Policy Checks; depends_on → Review Publication; depends_on → Secrets and Configuration
Messages/events consumed	REQ-PRR-003, REQ-PRR-006

Communication Aspect	View-Scoped Detail
Messages/events produced	depends_on → AWS Bedrock Runtime API; depends_on → Policy Checks; depends_on → Review Publication; depends_on → Secrets and Configuration
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	AWS Bedrock Runtime API, Policy Checks, Review Publication, Secrets and Configuration
Communication evidence	code modules: review_orchestrator

6.6.7. Review Publication (FU-REVIEW-PUBLICATION)

Group: FG-REVIEW-INTELLIGENCE

Review Publication Communication

Posts summaries and inline annotations through GitHub App APIs.

Communication Aspect	View-Scoped Detail
Inbound interfaces	Review Orchestration
Outbound interfaces	depends_on → GitHub App API; depends_on → Secrets and Configuration
Messages/events consumed	REQ-PRR-005, REQ-PRR-006, REQ-PRR-007, REQ-PRR-008
Messages/events produced	depends_on → GitHub App API; depends_on → Secrets and Configuration
Retry/idempotency expectations	Not explicitly modeled in authored mappings; define per interface contract as needed.
Timeout/failure behavior	GitHub App API, Secrets and Configuration
Communication evidence	code modules: review_publication

7. Deployment View

Show inferred deployment artifacts and ownership mapping to authored units. This view emphasizes deployment relationships and platform operations.

7.1. What This View Answers

- How does authored intent become deployed runtime?
- What control-plane objects manage deployable units?
- Where are platform ownership boundaries and missing ownership signals?

7.2. Coverage Gaps

Coverage summary: 0/7 units have direct evidence coverage in this view.

- GitHub Webhook Ingress has no direct inferred runtime/deployment evidence yet.
- Lambda Runtime Operations has no direct inferred runtime/deployment evidence yet.
- PR Context Assembly has no direct inferred runtime/deployment evidence yet.
- Policy Checks has no direct inferred runtime/deployment evidence yet.
- Review Orchestration has no direct inferred runtime/deployment evidence yet.
- Review Publication has no direct inferred runtime/deployment evidence yet.
- Secrets and Configuration has no direct inferred runtime/deployment evidence yet.

7.3. Recommended Next Evidence Additions

- Add owner metadata to Flux/Kustomization/Helm objects for clearer platform ownership mapping.
- Ensure deployment control artifacts (source, kustomization, release) are all included in scanned directories.
- Add deterministic naming conventions for release and namespace objects to improve cross-artifact linking.

7.4. Deployment Artifact Relationship Graph

What this diagram shows: how source/control-plane artifacts connect to releases, namespaces, workloads, and target cluster context.

NOTE	This graph is inferred from available deployment artifacts (for example Terraform, Flux, Helm) and may be partial when source metadata is incomplete. NOTE: Namespace and cluster boundaries are rendered as containers when target/placement relationships are inferred. NOTE: Node labels include role hints (for example Source, Kustomization, Release, Workload, ns/...) to make similarly named elements easier to distinguish.

7.5. Platform Operations Graph

What this diagram shows: which platform actors operate which platform units and the control-plane targets they influence.

> **NOTE** Platform operations links are inferred from authored actor mappings plus discovered deployment control-plane artifacts.

7.6. Functional Groups (View Scoped)

7.6.1. PR Integration (FG-PR-INTEGRATION)

PR Integration Deployment

PR Integration functions deploy independently to isolate webhook ingress from context-fetch implementation changes.

7.6.2. Review Intelligence (FG-REVIEW-INTELLIGENCE)

Review Intelligence Deployment

Review Intelligence units roll independently to preserve availability and reduce blast radius during model or rule updates.

7.6.3. Platform Operations (FG-PLATFORM-OPERATIONS)

Platform Operations Deployment

Platform Operations governs release orchestration and runtime placement to keep review capacity stable.

7.7. Functional Units (View Scoped)

7.7.1. Lambda Runtime Operations (FU-LAMBDA-RUNTIME-OPERATIONS)

Group: FG-PLATFORM-OPERATIONS

Lambda Runtime Operations Deployment

Governs source-to-release pipeline behavior and runtime placement boundaries.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	no explicit authored requirement trigger
Deployment dependencies	AWS Secrets Manager, Secrets and Configuration
Inferred deployment evidence	code modules: lambda_runtime_ops

7.7.2. Secrets and Configuration (FU-SECRETS-CONFIGURATION)

Group: FG-PLATFORM-OPERATIONS

Secrets and Configuration Deployment

Managed as a shared operational boundary with controlled rotation and rollout flow.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-007
Deployment dependencies	none
Inferred deployment evidence	code modules: secrets_configuration

7.7.3. GitHub Webhook Ingress (FU-GITHUB-WEBHOOK-INGRESS)

Group: FG-PR-INTEGRATION

GitHub Webhook Ingress Deployment

Deploys as an independently managed Lambda runtime boundary.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-001, REQ-PRR-008
Deployment dependencies	PR Context Assembly
Inferred deployment evidence	code modules: webhook_ingress

7.7.4. PR Context Assembly (FU-PR-CONTEXT-ASSEMBLY)

Group: FG-PR-INTEGRATION

PR Context Assembly Deployment

Deployed separately to allow context shaping changes without ingress disruption.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-002
Deployment dependencies	GitHub App API, Review Orchestration
Inferred deployment evidence	code modules: pr_context_assembly

7.7.5. Policy Checks (FU-POLICY-CHECKS)

Group: FG-REVIEW-INTELLIGENCE

Policy Checks Deployment

Deployed independently to evolve policy logic without model coupling.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-004, REQ-PRR-006
Deployment dependencies	Review Policy Ruleset
Inferred deployment evidence	code modules: policy_checks

7.7.6. Review Orchestration (FU-REVIEW-ORCHESTRATION)

Group: FG-REVIEW-INTELLIGENCE

Review Orchestration Deployment

Isolated deployment enables cautious model/config rollout and fallback control.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-003, REQ-PRR-006
Deployment dependencies	AWS Bedrock Runtime API, Policy Checks, Review Publication, Secrets and Configuration
Inferred deployment evidence	code modules: review_orchestrator

7.7.7. Review Publication (FU-REVIEW-PUBLICATION)

Group: FG-REVIEW-INTELLIGENCE

Review Publication Deployment

Release isolation protects publication reliability during other unit rollouts.

Deployment Aspect	View-Scoped Detail
Deployment trigger context	REQ-PRR-005, REQ-PRR-006, REQ-PRR-007, REQ-PRR-008
Deployment dependencies	GitHub App API, Secrets and Configuration
Inferred deployment evidence	code modules: review_publication

8. Security View

Show inferred exposure and dependency risk points aligned to unit boundaries, focused on attack paths and security evidence.

8.1. What This View Answers

- What are the main trust boundaries and attack paths?
- Which units are exposed and what security evidence exists?
- Where is the threat model incomplete?

8.2. Coverage Gaps

Coverage summary: 5/7 units have direct evidence coverage in this view.

- Lambda Runtime Operations has no explicit authored attack-vector mapping yet; document technical and fraud/abuse threats even when mitigated.
- Policy Checks has no explicit authored attack-vector mapping yet; document technical and fraud/abuse threats even when mitigated.

8.3. Recommended Next Evidence Additions

- Add explicit authored attack-vector mappings for units currently marked without threat linkage.
- Add security signal ownership metadata (logs/alerts/events) for unresolved observability evidence.
- Map additional security-relevant dependencies and exposures into authored mappings for traceable coverage.

8.4. Attack Path Diagram

What this diagram shows: authored attack vectors, their targeted units, and security-relevant dependency paths.

NOTE	Security relationships shown here are explicitly modeled or inferred from available evidence and may be incomplete. Absence of a path does not imply absence of risk. NOTE: Threats that are currently mitigated (including fraud/abuse threats) should still be modeled as attack vectors for auditability and control-trace visibility.

8.5. Security Logging and Observability

Signal	Layer	Owner	Evidence
deployment and platform audit events	deployment	unresolved	terraform_resource review_orchestrator
deployment and platform audit events	deployment	unresolved	terraform_resource review_publisher
deployment and platform audit events	deployment	unresolved	terraform_resource webhook_ingress

8.6. Functional Groups (View Scoped)

8.6.1. PR Integration (FG-PR-INTEGRATION)

PR Integration Security

PR Integration protects signature verification and hostile-diff ingress paths to reduce spoofing and prompt injection risk.

8.6.2. Review Intelligence (FG-REVIEW-INTELLIGENCE)

Review Intelligence Security

Review Intelligence emphasizes prompt hardening, output redaction, and secure publication boundaries.

8.6.3. Platform Operations (FG-PLATFORM-OPERATIONS)

Platform Operations Security

Platform Operations secures credential paths and operational controls across Lambda deployment lifecycle.

8.7. Functional Units (View Scoped)

8.7.1. Lambda Runtime Operations (FU-LAMBDA-RUNTIME-OPERATIONS)

Group: FG-PLATFORM-OPERATIONS

Lambda Runtime Operations Security

Hardens operational control loops and protects deployment trust boundaries.

Attack surface: no explicit attack vector targeting this unit Main threats: no explicit attack vector targeting this unit Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: AWS Secrets Manager, Secrets and Configuration Security evidence present: code modules: lambda_runtime_ops Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.2. Secrets and Configuration (FU-SECRETS-CONFIGURATION)

Group: FG-PLATFORM-OPERATIONS

Secrets and Configuration Security

Enforces credential isolation, least-privilege access, and redaction-safe metadata handling.

Attack surface: Secret Leakage in Review Output Main threats: Secret Leakage in Review Output Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: none Security evidence present: code modules: secrets_configuration Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.3. GitHub Webhook Ingress (FU-GITHUB-WEBHOOK-INGRESS)

Group: FG-PR-INTEGRATION

GitHub Webhook Ingress Security

Enforces signature verification and rejects spoofed or malformed events.

Attack surface: Pull Request Spam Abuse, Spoofed GitHub Webhook Main threats: Pull Request Spam Abuse, Spoofed GitHub Webhook Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: PR Context Assembly Security evidence present: code modules: webhook_ingress Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.4. PR Context Assembly (FU-PR-CONTEXT-ASSEMBLY)

Group: FG-PR-INTEGRATION

PR Context Assembly Security

Applies contextual sanitization to reduce prompt injection risk from diffs.

Attack surface: Prompt Injection in Diff Main threats: Prompt Injection in Diff Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: GitHub App API, Review Orchestration Security evidence present: code modules: pr_context_assembly Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.5. Policy Checks (FU-POLICY-CHECKS)

Group: FG-REVIEW-INTELLIGENCE

Policy Checks Security

Provides deterministic controls for secrets and risky infrastructure changes.

Attack surface: no explicit attack vector targeting this unit Main threats: no explicit attack vector targeting this unit Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: Review Policy Ruleset Security evidence present: code modules: policy_checks Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.6. Review Orchestration (FU-REVIEW-ORCHESTRATION)

Group: FG-REVIEW-INTELLIGENCE

Review Orchestration Security

Enforces safe prompt construction and bounded output handling under adversarial input.

Attack surface: Prompt Injection in Diff, Pull Request Spam Abuse Main threats: Prompt Injection in Diff, Pull Request Spam Abuse Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: AWS Bedrock Runtime API, Policy Checks, Review Publication, Secrets and Configuration Security

evidence present: code modules: review_orchestrator Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

8.7.7. Review Publication (FU-REVIEW-PUBLICATION)

Group: FG-REVIEW-INTELLIGENCE

Review Publication Security

Applies redaction and policy-aware output filtering before publishing findings.

Attack surface: Secret Leakage in Review Output Main threats: Secret Leakage in Review Output Expected controls: define control expectations in authored security narratives and mapped dependencies. Security-relevant dependencies: GitHub App API, Secrets and Configuration Security evidence present: code modules: review_publication Security evidence missing: close any unresolved ownership or unmapped threat-linkage gaps in Traceability View.

9. Traceability View

Show requirement-to-unit-to-evidence traceability, including coverage confidence and explicit evidence gaps.

9.1. What This View Answers

- Which requirements map to which units?
- Which authored units have runtime/code evidence and which do not?
- Where are confidence or completeness gaps in trace coverage?

9.2. Coverage Gaps

Coverage summary: 7/7 units have direct evidence coverage in this view.

- GitHub Webhook Ingress has no direct inferred runtime evidence yet.
- Lambda Runtime Operations has no direct inferred runtime evidence yet.
- PR Context Assembly has no direct inferred runtime evidence yet.
- Policy Checks has no direct inferred runtime evidence yet.
- Review Orchestration has no direct inferred runtime evidence yet.
- Review Publication has no direct inferred runtime evidence yet.
- Secrets and Configuration has no direct inferred runtime evidence yet.

9.3. Recommended Next Evidence Additions

- Add explicit requirement-to-owner mappings where requirement scope is currently broad or ambiguous.
- Add ownership annotations for runtime and code artifacts where coverage is still unresolved.
- Prioritize closing gaps for units that are authored but lack both runtime and code evidence.

9.4. Traceability Evidence Graph

What this diagram shows: authored units and the inferred evidence links that support traceability confidence.

> **NOTE** This graph summarizes inferred ownership/evidence links and is intended for traceability confidence checks.

9.5. Requirement-to-Unit Mapping

What this diagram shows: direct authored mapping from requirements to the functional units they apply to.

REQ-PRR-001

9.6. Requirement-to-Unit-to-Evidence Coverage

What this diagram shows: requirement-to-unit links extended with inferred runtime/code evidence attached to each unit.

Show requirement-to-unit mappings inferred from appliesTo and authored architecture ownership boundaries.

10. Traceability Appendix

10.1. Requirement Details

10.1.1. REQ-PRR-001

While pull request review is active, when pull request synchronize event is received, the pr review system shall verify webhook signature before processing review workflow. Notes: Webhook trust boundary validation.

10.1.2. REQ-PRR-002

While pull request review is active, when pull request opened event is received, the pr review system shall fetch changed files and construct diff context for review execution. Notes: Context ingestion from GitHub API.

10.1.3. REQ-PRR-003

Where ai review is enabled, when diff context is prepared, the pr review system shall request bedrock runtime analysis for security, architecture, and maintainability findings. Notes: AI-assisted review path.

10.1.4. REQ-PRR-004

Where policy checks are enabled, when pull request review is active, the pr review system shall evaluate deterministic policy checks for secret exposure, infrastructure risk, and dependency changes. Notes: Deterministic non-LLM review checks.

10.1.5. REQ-PRR-005

While pull request review is active, when review findings are generated, the pr review system shall publish check run summary and inline comments to repository maintainer. Notes: Result publication contract.

10.1.6. REQ-PRR-006

If bedrock runtime is unavailable, then the pr review system shall publish deterministic policy-only review outcome. Notes: Graceful degradation requirement.

10.1.7. REQ-PRR-007

Where audit logging is enabled, when review findings are published, the pr review system shall persist redacted prompt and result metadata for audit traceability. Notes: Evidence and audit lineage.

10.1.8. REQ-PRR-008

If review request rate limit is exceeded, then the pr review system shall defer processing and notify repository maintainer. Notes: Abuse and capacity protection behavior.

10.2. Verification Inventory

What this section shows: verification checks inferred from test artifacts, linked to test code elements and mapped to verified requirements.

10.2.1. Pr Opened Review Flow

Field	Value
ID	VER-INF-E2E-PR_OPENED_REVIEW_FLOW-6BF0B5

Field	Value
Kind	e2e
Status	pass
Verifies Requirements	REQ-PRR-001, REQ-PRR-002, REQ-PRR-003, REQ-PRR-005
Test Code Elements	tests/e2e/pr_opened_review_flow.yaml
Derived Functional Owners	FU-GITHUB-WEBHOOK-INGRESS, FU-PR-CONTEXT-ASSEMBLY, FU-REVIEW-ORCHESTRATION, FU-REVIEW-PUBLICATION
Result Summary	pass:4
Evidence	test-results/e2e-pr-opened-review.xml, tests/e2e/pr_opened_review_flow.yaml
Notes	Inferred from test source artifact.

10.2.2. Audit Redaction Test

Field	Value
ID	VER-INF-INTEGRATION-AUDIT_REDACTION_TEST-B108A1
Kind	integration
Status	pass
Verifies Requirements	REQ-PRR-007
Test Code Elements	tests/integration/audit_redaction_test.ts
Derived Functional Owners	FU-REVIEW-PUBLICATION, FU-SECRETS-CONFIGURATION
Result Summary	pass:1
Evidence	test-results/audit-redaction-report.md, tests/integration/audit_redaction_test.ts
Notes	Inferred from test source artifact.

10.2.3. Policy Only Fallback Test

Field	Value
ID	VER-INF-INTEGRATION-POLICY_ONLY_FALLBACK_TEST-76E20A
Kind	integration
Status	pass

Field	Value
Verifies Requirements	REQ-PRR-004, REQ-PRR-006
Test Code Elements	tests/integration/policy_only_fallback_test.rs
Derived Functional Owners	FU-POLICY-CHECKS, FU-REVIEW-ORCHESTRATION, FU-REVIEW-PUBLICATION
Result Summary	pass:2
Evidence	test-results/integration-policy-fallback.json, tests/integration/policy_only_fallback_test.rs
Notes	Inferred from test source artifact.

10.2.4. Github Check Run Contract Test

Field	Value
ID	VER-INF-TEST-GITHUB_CHECK_RUN_CONTRACT_TEST-17DBA6
Kind	test
Status	pass
Verifies Requirements	REQ-PRR-005
Test Code Elements	tests/contract/github_check_run_contract_test.go
Derived Functional Owners	FU-REVIEW-PUBLICATION
Result Summary	pass:1
Evidence	test-results/contract-checkrun.json, tests/contract/github_check_run_contract_test.go
Notes	Inferred from test source artifact.

10.2.5. Rate Limit Deferral Test

Field	Value
ID	VER-INF-UNIT-RATE_LIMIT_DEFERRAL_TEST-DC9EB2
Kind	unit
Status	pass
Verifies Requirements	REQ-PRR-008
Test Code Elements	tests/unit/rate_limit_deferral_test.go

Field	Value
Derived Functional Owners	FU-GITHUB-WEBHOOK-INGRESS, FU-REVIEW-PUBLICATION
Result Summary	pass:1
Evidence	test-results/unit-rate-limit.xml, tests/unit/rate_limit_deferral_test.go
Notes	Inferred from test source artifact.

10.3. Verification Result Mapping

What this section shows: per-requirement result mapping inferred from test-result artifacts.

Check ID	Requirement	Result	Evidence / Notes
VER-INF-E2E-PR_OPENED_REVIEW_FLOW-6BF0B5	REQ-PRR-001	pass	test-results/e2e-pr-opened-review.xml
VER-INF-E2E-PR_OPENED_REVIEW_FLOW-6BF0B5	REQ-PRR-002	pass	test-results/e2e-pr-opened-review.xml
VER-INF-E2E-PR_OPENED_REVIEW_FLOW-6BF0B5	REQ-PRR-003	pass	test-results/e2e-pr-opened-review.xml
VER-INF-INTEGRATION-POLICY_ONLY_FALLBACK_TEST-76E20A	REQ-PRR-004	pass	test-results/integration-policy-fallback.json deterministic policy checks executed
VER-INF-E2E-PR_OPENED_REVIEW_FLOW-6BF0B5	REQ-PRR-005	pass	test-results/e2e-pr-opened-review.xml
VER-INF-TEST-GITHUB_CHECK_RUN_CONTRACT_TEST-17DBA6	REQ-PRR-005	pass	test-results/contract-checkrun.json check run payload includes summary and neutral conclusion
VER-INF-INTEGRATION-POLICY_ONLY_FALLBACK_TEST-76E20A	REQ-PRR-006	pass	test-results/integration-policy-fallback.json policy-only fallback published
VER-INF-INTEGRATION-AUDIT_REDACTION_TEST-B108A1	REQ-PRR-007	pass	test-results/audit-redaction-report.md
VER-INF-UNIT-RATE_LIMIT_DEFERRAL_TEST-DC9EB2	REQ-PRR-008	pass	test-results/unit-rate-limit.xml

11. Reference Index

11.1. Authored References

ACT-DEVELOPER

Kind: Actor Name: Developer

Opens pull requests and receives review feedback.

ACT-PLATFORM-OPERATOR

Kind: Actor Name: Platform Operator

Operates Lambda deployment and runtime controls.

ACT-REPOSITORY-MAINTAINER

Kind: Actor Name: Repository Maintainer

Owns merge decisions and repository-level quality gates.

ACT-SECURITY-ENGINEER

Kind: Actor Name: Security Engineer

Curates policy checks and triages security findings.

AV-PR-SPAM-ABUSE

Kind: Attack Vector Name: Pull Request Spam Abuse

High-rate PR event flooding that can exhaust review capacity.

AV-PROMPT-INJECTION-IN-DIFF

Kind: Attack Vector Name: Prompt Injection in Diff

Malicious prompt-like content embedded in pull request diffs.

AV-SECRET-LEAKAGE-IN-REVIEW

Kind: Attack Vector Name: Secret Leakage in Review Output

Generated findings accidentally exposing secrets/tokens in comments.

AV-SPOOFED-GITHUB-WEBHOOK

Kind: Attack Vector Name: Spoofed GitHub Webhook

Forged webhook payload attempting unauthorized review execution.

FG-PLATFORM-OPERATIONS

Kind: Functional Group Name: Platform Operations

Lambda deployment lifecycle, runtime operations, and secrets/configuration.

FG-PR-INTEGRATION

Kind: Functional Group Name: PR Integration

Ingress and context assembly for GitHub pull request events.

FG-REVIEW-INTELLIGENCE

Kind: Functional Group Name: Review Intelligence

AI and deterministic review analysis with result publication.

FU-GITHUB-WEBHOOK-INGRESS

Kind: Functional Unit Name: GitHub Webhook Ingress

Verifies webhook signatures, validates event type, and starts review workflow routing.

FU-LAMBDA-RUNTIME-OPERATIONS

Kind: Functional Unit Name: Lambda Runtime Operations

Manages Lambda packaging/deployment lifecycle and operational health guardrails.

FU-POLICY-CHECKS

Kind: Functional Unit Name: Policy Checks

Runs deterministic checks for secrets, risky IaC changes, and repository policy constraints.

FU-PR-CONTEXT-ASSEMBLY

Kind: Functional Unit Name: PR Context Assembly

Fetches changed files and diff metadata and prepares bounded review context payloads.

FU-REVIEW-ORCHESTRATION

Kind: Functional Unit Name: Review Orchestration

Calls Bedrock models, merges AI and deterministic findings, and handles graceful degradation paths.

FU-REVIEW-PUBLICATION

Kind: Functional Unit Name: Review Publication

Publishes check-run summaries and inline comments back to GitHub pull requests.

FU-SECRETS-CONFIGURATION

Kind: Functional Unit Name: Secrets and Configuration

Manages GitHub App credentials, Bedrock config, and redaction-safe runtime configuration.

REF-AWS-BEDROCK-RUNTIME

Kind: Referenced Element Name: AWS Bedrock Runtime API

external_service_endpoint / runtime

REF-AWS-SDK-GO

Kind: Referenced Element Name: AWS SDK for Go

third_party_library / code

REF-AWS-SECRETS-MANAGER

Kind: Referenced Element Name: AWS Secrets Manager

platform_service / runtime

REF-GITHUB-APP-API

Kind: Referenced Element Name: GitHub App API

external_service_endpoint / runtime

REF-GITHUB-REST-SDK

Kind: Referenced Element Name: GitHub REST SDK

third_party_library / code

REF-POLICY-RULESET

Kind: Referenced Element Name: Review Policy Ruleset

policy_bundle / code

REQ-PRR-001

Kind: Requirement Name: REQ-PRR-001 Resolves to: canonical While pull request review is active, when pull request synchronize event is received, the pr review system shall verify webhook signature before processing review workflow.

REQ-PRR-002

Kind: Requirement Name: REQ-PRR-002 Resolves to: canonical While pull request review is active, when pull request opened event is received, the pr review system shall fetch changed files and construct diff context for review execution.

REQ-PRR-003

Kind: Requirement Name: REQ-PRR-003 Resolves to: canonical Where ai review is enabled, when diff context is prepared, the pr review system shall request bedrock runtime analysis for security, architecture, and maintainability findings.

REQ-PRR-004

Kind: Requirement Name: REQ-PRR-004 Resolves to: canonical Where policy checks are enabled, when pull request review is active, the pr review system shall evaluate deterministic policy checks for secret exposure, infrastructure risk, and dependency changes.

REQ-PRR-005

Kind: Requirement Name: REQ-PRR-005 Resolves to: canonical While pull request review is active, when review findings are generated, the pr review system shall publish check run summary and inline comments to repository maintainer.

REQ-PRR-006

Kind: Requirement Name: REQ-PRR-006 Resolves to: canonical If bedrock runtime is unavailable, then the pr review system shall publish deterministic policy-only review outcome.

REQ-PRR-007

Kind: Requirement Name: REQ-PRR-007 Resolves to: canonical Where audit logging is enabled, when review findings are published, the pr review system shall persist redacted prompt and result metadata for audit traceability.

REQ-PRR-008

Kind: Requirement Name: REQ-PRR-008 Resolves to: canonical If review request rate limit is exceeded, then the pr review system shall defer processing and notify repository maintainer.

11.2. Catalog References

ACT-DEVELOPER

Kind: Catalog Actor Name: developer Resolves to: canonical Engineer opening and updating pull requests.

ACT-PLATFORM-OPERATOR

Kind: Catalog Actor Name: platform operator Resolves to: canonical Owner of deployment/runtime operations and reliability controls.

ACT-REPOSITORY-MAINTAINER

Kind: Catalog Actor Name: repository maintainer Resolves to: canonical Owner of merge decisions and repository quality gates.

ACT-SECURITY-ENGINEER

Kind: Catalog Actor Name: security engineer Resolves to: canonical Owner of security policy checks and finding triage.

ai review enabled

Kind: Catalog Alias Name: ai review is enabled Resolves to: canonical Alias of FEAT-AI-REVIEW

audit enabled

Kind: Catalog Alias Name: webhook signature is valid Resolves to: canonical Alias of COND-WEBHOOK-SIGNATURE-VALID

webhook ingress

Kind: Catalog Alias Name: github webhook ingress Resolves to: canonical Alias of FU-GITHUB-WEBHOOK-INGRESS

webhook spoofing

Kind: Catalog Alias Name: spoofed github webhook Resolves to: canonical Alias of AV-SPOOFED-GITHUB-WEBHOOK

AV-PR-SPAM-ABUSE

Kind: Catalog Attack Vector Name: pull request spam abuse Resolves to: canonical High-volume event abuse causing review capacity exhaustion.

AV-PROMPT-INJECTION-IN-DIFF

Kind: Catalog Attack Vector Name: prompt injection in diff Resolves to: canonical Malicious prompt-like content embedded in pull request code changes.

AV-SECRET-LEAKAGE-IN-REVIEW

Kind: Catalog Attack Vector Name: secret leakage in review output Resolves to: canonical Unintended credential disclosure in generated review findings.

AV-SPOOFED-GITHUB-WEBHOOK

Kind: Catalog Attack Vector Name: spoofed github webhook Resolves to: canonical Forged webhook request attempting unauthorized review execution.

COND-WEBHOOK-SIGNATURE-VALID

Kind: Catalog Condition Name: webhook signature is valid Resolves to: canonical Condition indicating webhook HMAC verification succeeded.

DATA-CHECKRUN-SUMMARY

Kind: Catalog Data Term Name: check run summary Resolves to: canonical Aggregated review result posted as a GitHub check run.

DATA-DIFF-CONTEXT

Kind: Catalog Data Term Name: diff context Resolves to: canonical Pull request file changes and metadata prepared for analysis.

DATA-REDACTED-AUDIT-METADATA

Kind: Catalog Data Term Name: redacted audit metadata Resolves to: canonical Sanitized prompt and finding metadata retained for audit.

DATA-RESULT-METADATA

Kind: Catalog Data Term Name: result metadata Resolves to: canonical Metadata describing review output characteristics for audit and reporting.

DATA-WEBHOOK-SIGNATURE

Kind: Catalog Data Term Name: webhook signature Resolves to: canonical Signature used to verify webhook authenticity.

EVT-BEDROCK-UNAVAILABLE

Kind: Catalog Event Name: bedrock runtime is unavailable Resolves to: canonical Event raised when Bedrock inference path is degraded.

EVT-CONTEXT-PREPARED

Kind: Catalog Event Name: diff context is prepared Resolves to: canonical Event indicating context assembly completed and is ready for analysis.

EVT-FINDINGS-GENERATED

Kind: Catalog Event Name: review findings are generated Resolves to: canonical Event indicating analysis output is ready for publication.

EVT-FINDINGS-PUBLISHED

Kind: Catalog Event Name: review findings are published Resolves to: canonical Event indicating review output has been published to GitHub checks/comments.

EVT-PR-OPENED

Kind: Catalog Event Name: pull request opened event is received Resolves to: canonical Event raised when a new pull request is opened.

EVT-PR-SYNCHRONIZE

Kind: Catalog Event Name: pull request synchronize event is received Resolves to: canonical Event raised when new commits are pushed to an open pull request.

EVT-RATE-LIMIT-EXCEEDED

Kind: Catalog Event Name: review request rate limit is exceeded Resolves to: canonical Event raised when PR review rate guardrails are hit.

FEAT-AI-REVIEW

Kind: Catalog Feature Name: ai review is enabled Resolves to: canonical Feature flag enabling model-assisted review.

FEAT-AUDIT-LOGGING

Kind: Catalog Feature Name: audit logging is enabled Resolves to: canonical Feature flag enabling audit metadata persistence.

FEAT-POLICY-CHECKS

Kind: Catalog Feature Name: policy checks are enabled Resolves to: canonical Feature flag enabling deterministic policy checks.

FG-PLATFORM-OPERATIONS

Kind: Catalog Functional Group Name: platform operations Resolves to: canonical Functional group for deployment lifecycle and secret/config controls.

FG-PR-INTEGRATION

Kind: Catalog Functional Group Name: pr integration Resolves to: canonical Functional group for webhook ingress and pull request context intake.

FG-REVIEW-INTELLIGENCE

Kind: Catalog Functional Group Name: review intelligence Resolves to: canonical Functional group for AI and deterministic review analysis and publication.

FU-GITHUB-WEBHOOK-INGRESS

Kind: Catalog Functional Unit Name: github webhook ingress Resolves to: canonical Validates webhook signatures and routes trusted pull request events.

FU-LAMBDA-RUNTIME-OPERATIONS

Kind: Catalog Functional Unit Name: lambda runtime operations Resolves to: canonical Manages runtime deployment and operational controls.

FU-POLICY-CHECKS

Kind: Catalog Functional Unit Name: policy checks Resolves to: canonical Evaluates deterministic repository policy checks.

FU-PR-CONTEXT-ASSEMBLY

Kind: Catalog Functional Unit Name: pr context assembly Resolves to: canonical Fetches changed files and prepares bounded review context payloads.

FU-REVIEW-ORCHESTRATION

Kind: Catalog Functional Unit Name: review orchestration Resolves to: canonical Coordinates Bedrock analysis with deterministic checks and fallback logic.

FU-REVIEW-PUBLICATION

Kind: Catalog Functional Unit Name: review publication Resolves to: canonical Publishes review findings to GitHub checks and comments.

FU-SECRETS-CONFIGURATION

Kind: Catalog Functional Unit Name: secrets and configuration Resolves to: canonical Manages credentials and secure runtime configuration.

MODE-NORMAL

Kind: Catalog Mode Name: normal mode is active Resolves to: canonical Default operating mode using AI plus deterministic checks.

REF-AWS-BEDROCK-RUNTIME

Kind: Catalog Referenced Element Name: bedrock runtime Resolves to: canonical External Bedrock runtime endpoint used for model inference.

REF-AWS-SDK-GO

Kind: Catalog Referenced Element Name: aws sdk for go Resolves to: canonical SDK dependency used for AWS runtime integrations.

REF-AWS-SECRETS-MANAGER

Kind: Catalog Referenced Element Name: aws secrets manager Resolves to: canonical Managed secret store for application credentials and config values.

REF-GITHUB-APP-API

Kind: Catalog Referenced Element Name: github app api Resolves to: canonical External GitHub API used for pull request metadata and review publication.

REF-GITHUB-REST-SDK

Kind: Catalog Referenced Element Name: github rest sdk Resolves to: canonical SDK dependency used for GitHub App REST interactions.

REF-POLICY-RULESET

Kind: Catalog Referenced Element Name: policy ruleset Resolves to: canonical Deterministic review policy bundle used during analysis.

STATE-PR-REVIEW-ACTIVE

Kind: Catalog State Name: pull request review is active Resolves to: canonical State where review processing is currently active for a pull request.
